Bus Blaster v4

SKU: 102990000

Description

Bus Blaster v4 is an experimental, high-speed JTAG debugger from Dangerous Prototypes (<http://dangerousprototypes.com/>).

Thanks to a reprogrammable buffer, a simple update over USB makes Bus Blaster compatible with many different JTAG debugger types in the most popular open source software.

- Based on FT2232H with high-speed USB 2.0
- Buffered interface works with 3.3volt to 1.8volt targets
- Reprogrammable buffer is compatible with multiple debugger types
- Compatible with 'jtagkey', 'KT-link' programmer settings in OpenOCD, urJTAG, and more
- ships with JTAGkey compatible buffer image pre-programmed
- Should support Serial Wire Debug when available
- Mini-CPLD development board: self programmable, extra CPLD pins to header
- Open source (CC-BY-SA)

Updates in v4:

- V4 uses a larger CPLD than previous versions. It can now support the SWV (<http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.ddi0314h/Chdigcfd.html>) feature of Cortex microcontroller for advance debugging when software support is available
- SWV is little used and not currently supported in software, most users will be better off with Bus Blaster v3 available here (http://www.seeedstudio.com/depot/bus-blaster-v3-p-1415.html?cPath=63_69)
- Fitted in a DP9056 (90x56 mm) standard PCB
- Added series resistors to input and output pins to protect against damage and noise

Each unit is tested before it ships.
